or disorder of nervous system which involves administering a modulator to condulate an activity of a neural stem cell or a neural progenitor cell in condulate an activity of a neural stem cell or a neural progenitor cell in condulate an activity of a neural stem cell or a neural progenitor cell in condulate an interaction between EphA7 and ephrin-A5 cor an interaction between EphA7 and ephrin-A2. The method is useful for alleviating a symptom of a disease or disorder of the nervous system, ce.g., drug and alcohol abuse, neurological traumas, or neurodegenerative, neural stem cell, neural progenitor, ischaemic, affective, neuropsychiatric or learning and memory disorders, such as Parkinson's disease, Huntington's disease, Alzheimer's disease, spinal ischaemia, amyotrophic lateral sclerosis, ischaemic stroke, spinal cord injury or cancer-related brain/spinal cord injury, schizophrenia, psychoses, componer control of the conductor of the nervous syndromes of disorders, spinal schaemia, stress and related syndromes, cognitive function disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotide sequence is the chimeric antisense oligo used to inhigexpression of human NOD1, the aim of the invention. Note that it has terminal five nucleotide 2-methoxyethyl (2'-MOE) wings separated by ten deoxynucleotide gap. The oligonucleotide backbone is phosphorothi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           aggression, obsessive compulsive behaviour syndromes, multi-infarct dementia, seasonal mood disorder, Lewy body dementia, borderline personality disorder, cerebral palsy, age related/geriatric dementia, epilepsy and injury related to epilepsy, spinal cord injury, brain injury, trauma related brain/spinal cord injury, anticancer treatment related brain/spinal cord tissue injury, infection and inflammation related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, environmental toxin related brain/spinal cord injury, retiral degenerative disorders, injury or trauma to the retina or sleep disorders. The invention is also used in gene therapy. The present sequence is a RT (reverse transcription)-PCR primer used for amplifying human ephrin-A2 cDNA. This sequence is used to
The invention relates to a method for alleviating a symptom of a disease or disorder of nervous system which involves administering a modulator to modulate an activity of a neural stem cell or a neural progenitor cell in vivo to a patient suffering from the disease or disorder of the nervous system (the modulator disrupts an interaction between EphA7 and ephrin-A5 or an interaction between EphA7 and ephrin-A5 and interaction between EphA7 and ephrin-A5 or alleviating a symptom of a disease or disorder of the nervous system, e.g., drug and alcohol abuse, neurological traumas, or neurodegenerative,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Huntington's disease; Alzheimer's disease; schizophrenia; gene therapy; memory disorder; Parkinson's disease; phobia; dementia; sleep disorder; amyotrophic lateral sclerosis; attention deficit disorder; depression;
                                                                                                                                                                                                                                                                                                                                                                          Alleviating a symptom of a disease or disorder of the nervous administering a modulator of neural stem or neural progenitor activity in vivo to a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-NOV-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
The invention relates to a novel method for directly amplifying nucleic acids in a sample without having to isolate it. The method comprises a step to inhibit the breakdown of nucleic acids. The invention further comprises: a solution for treating the nucleic acid sample; a method for treating the sample; a reagent for detecting nucleic acids; a nucleic acid detection system; and a method for detecting cancer metastasis. This polynucleotide represents a PCR primer used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     into a chicken embryo. Compositions comprising cultures of embryonic chicken embryonic stem cells are useful in producing engineered chickens for avian transgenics, including protein production for pharmaceutical industry, production of chickens that deposit human antibodies in their eggs, and site-specific modification of the avian genome for other applications. The cultures may be used in the selection of desirable phenotypes in chimeric animals and modifications to the genome of chicken embryonic cells to introduce exogenous DNA into a chimeric offspring. Sequences ACF36177-186 represent primers used in a PCR analysis of transgenes for the presence of an unrearranged human heavy chain locus
                                                                                                                                                                                                                                              breakdown.

CC single nuclectide polymorphism (SNP) chosen from: (1) a nucleic acid of CS single nuclectide polymorphism (SNP) chosen from: (1) a nucleic acid of CC (1) or its complement under highly stringent hybridistions. (CC (1) or its complement under highly stringent hybridistions. (CC (1) or its complement under highly stringent hybridistion conditions. (CC (1) contiguous nuclectides of a nuclectide sequence of S. salar SNPs, O. filoticus SNPs, O. inloticus microsatellites, Atlantic halibut SNPs, Cod (1) polymorphic sites and seabass polymorphic sites, or their complement; (2) CC a primer pair (III) suitable for use in PCR, comprising two (II) capable of anymorphic sites and seabass polymorphic sites, Atlantic halibut SNPs, cod (1) comprising a nuclectide sequence chosen from S. salar SNPs and, O. (1) capable (1) comprising a nuclectide sequence chosen from S. salar SNPs and, O. (1) contiducts sNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod (2) corigin of fish sample comprising providing a parentage genotype database (2) corigin of fish sample comprising providing a parentage genotype database (2) candidate parent genotype represents a distinct origin, and comparing a comprising a collection of the candidate parent genotype identifies (2) the sample genotype and one of the candidate parent genotype identifies (2) to the origin of the sample. (M1) is useful for detecting nucleic acid molecule comprising sucleic acids with one or more (2) contident from nucleotide sequence of S. salar SNPs and O. niloticus (2) contident for detecting nucleic acid that hybridises to (II) (II) is contident for detecting nucleic acid molecule comprising a polymorphic contacting contacting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 3090
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ... 12. 989
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated nucleic acid (I) comprising single nucleotide polymorphism (SNP) chosen from: (1) a nucleic acid of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lie O,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Orechromis niloticus; Atlantic halibut; microsatellite; polymorphic site; seabass; salmonidae; Tilapia; rainbow

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acids with one or more (II) which is derived from O. niloticus microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II) (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  modified_base

The compound inhibits the expression of haematopoietic cell protein tyrosine kinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase or with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the tyrosine kinase. The antisense compounds are useful for modulating the expression of haematopoietic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as hyperproliferative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological
                                                                                                                                         Investigating male genetic infertility, useful for diagnosis e.g. for assessing suitabilty for in vitro fertilization, based on multifactorial analysis of infertility-related mutations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
```

This invention describes a novel method for investigating genetic infertility or predisposition in males. The method involves selecting least two infertility-associated mutations which are recessive or intermediate that are associated with infertility in the heterozygous state and/or only in the homozygous state. Preferably at least one azoospermia factor is detected which may be lost by microdeletions in intervals 5 or 6 of the Y-chromosome. Also any of several hundred

CC conductance regulator (CTFR), Kallmann syndrome (KAL1), androgen
CC resistance (AR) or steroid 21-hydroxylase (CYP21) genes may be detected.
CC Probes for the mutated genes and/or native nucleic acid, or their
CC complementary strands, are fixed to a carrier, particularly as a
CC microarray, then tested for hybridization with oligonuclectides from or
CC synthesized from, a patient sample and hybridization detected.
CC Multifactorial analysis is by standard statistical methods, particularly
CC the quantitative trait locus method. The method is used to diagnose
CC conjunction with in vitro fertilization programs, e.g. for assessing
CC conjunction with oligospermia for possible application of the
CC conjunction with oligospermia for possible application of the
CC intracytoplasmic sperm injection method. Analysis of many mutations
CC subjects with oligospermia for possible application of the
CC intracytoplasmic sperm injection method. Analysis of many mutations
CC conjunctions). A chip for analyzing genetic infertility in males comprises
CC oligonucleotides that represent known mutations (nonsense or missence,
CC insertions, allelic variants deletions or rearrangements) in the cystic
CC fibrosis transmembrane conductance regulator. Kallmann syndrome. androgen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

assaying a cellular material sample from known origin. It can be used to determine if an animal by susceptibility to porcine (especially pigs) to pRRSV and to compare susceptibility to a known origin. It can be used to determine the susceptibility as frown susceptibility to a known susceptibility to a known susceptibility to a known susceptibility as the susceptibility to a known origin. It can be used to determine if an animal of the same origin. It can be used to determine if an animal of the same origin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of predicting the potential of oligonucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligonucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligonucleotides for each of multiple target sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonucleotides. The present sequence represents a HIV PRT antisense derived probe.
                                                                                                                                                                                                                                                                                                                                                                               Determination of susceptibility to porcine reproductive and respiratory syndrome virus non-invasively useful e.g. to breed pigs with low susceptibility or classify infection resistance in an animal, by assaying the control of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             porcine reproductive and respiratory syndrome virus; PRRSV; susceptibility; CD 151; susceptibility standard; PRRSV infection; vaccine; vaccine virus stock; non-simian vaccine; xenotransplantion; non-simian cell line; drug testing; transformed cell line; porcine; pig;

It is especially useful to select animals for CC least 50 % lower) than a known standard (especially for material of the CC same cellular origin). Polymucleotides encoding CD 151 are useful to CC produce vaccines and to modify PRRSV production in cells susceptible to CC PRRSV infection, especially to increase PRRSV production e.g. in vaccine CC virus stock. They are especially useful to produce non-simian vaccines, cavoiding possible introduction of primate viruses into organs CC vaccines planted from pigs to humans. They may be used to determine the CC entert of single nucleotide polymorphisms on PRRSV susceptibility, and to CC compare PRRSV susceptibility factors between individual swine. They can also be used to modulate viral RNA (especially PRRSV RNA) entry into CC cells by altering CD 151 amounts in cells. Folymucleotides may be CC included in plasmids useful to render a cell line susceptible to PRRSV infection, useful to produce non-simian lines for drug testing. They may be included in vectors and used to integrate CD 151 into a chromosome. CC diagnose PRRSV infection in swine herds or produce vaccines for inducing CC immunity against PRRSV. This sequence represents a primer used to continue sequence of a porcine CD 151 intron in order to determine the critice sequence of porcine CD 151 intron in order to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                              The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cycostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, noctropic, antiparkinsonian, antiathmatic and gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the RT-PCR primer of the invention which was used to amplify human NOV man

The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines. (Updated on 25-MAR-2003 to correct PN field.) The amplified sequences represent the 5S region of the ribosomal (r)DNA repeat and contain polymorphisms. These polymorphisms may be used in a method for the identification of different grape cultivars. The amplified clones contain simple repeat sequences and may be identified in a genomic library of grapevine DNA using simple direction retera-nucleotide repeats such as (AT)8, (GT)10, (GT)10 and such like as probes. See also AAQ55231-50. (Updated on 25-MAR-2003 to correct

The second structure also contains a stem-loop structure and a second nucleic structure able to form a stable base-paired helix, designated the nucleotide clamp. The analogues pref. contain the complete sequence of the 16S rRNA decoding region (the decoding region being the region which correctly aligns the mRNA with the tRNA in the "A site" of the ribosome during protein synthesis). The sequences ATI6748-52 were used to generate analogues of the invention esp. for aminglycoside protection assays. The analogues can be used in assays to detect potential ligands e.g. new antibiotics or anti-viral agents, that could bind to the parent

Mutations in the PKD1 gene are associated CC with autosomal dominant polycystic kidney disease (ADPKD). Mutations CC within the PKD1 gene are responsible for approx. 90% of cases of ADPKD. CT for coding region of the PKD1 gene is complex and extensive. It covers CC approx. 60 kb and contains a total of 46 exons. It has been localised to CC within a 750 kb chromosomal region on the short arm of chromosome 16. CC approximately the first two thirds of the PKD1 gene is duplicated several CC times in a transcribed fashion elsewhere in the genome. The PKD1 gene CC also contains extensive repeated regions of high GC content. A number of CC cDNA clones. The PKD1 protein contains at least 5 distinct peptide CC domains which are likely to be involved in protein-protein and/or protein contents which are likely to be involved in protein-protein and/or protein may be used in the detection of mutant PKD1 and, therefore, CC diagnosis of ADPKD. Fragments of the PKD1 gene may be used in "mini" gene CC therapy for the treatment of ADPKD. (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The sequences given in AAT86037-43 are primers which were used in the amplification of regions of the murine V-alpha-1 intron and the V-alpha-1 'promoter. The amplified sequences were used in the isolation of the antisense strand of the T-cell receptor gene which encodes a signalling protein which comprises a proline rich region, a YXXI/I motif and a TANYSNI motif. Expression of the signalling protein sequence is activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense; T-cell receptor; signalling protein; intron; murine; V-alpha-1 gene; cytoplasmic tail; Ig-beta; P8.6; primer; amplif

                                                                                                AAV62907-V62927 are PCR primers used in the amplification of a human galactokinase. This protein is used in a method to detect galactokinase mutations. This protein and its encoding nucleic be used in methods allowing the detection, diagnosis and treatm human galactokinase deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              murine V-alpha-1 gene. The encoded protein has a molecular weight of the cycles and has a high degree of homology (e.g. 70%) to the cytoplasmic for Ig-beta. The murine signalling protein P8.6 and its homologues, from human lymphoid cells, can be used to further elucidate the rol the T cell receptor V-alpha-1 gene locus in the functioning of T ce
                                                                             Sequence 21
                                                                                                                                                               Example
                                                                                                                                                                                               Detection

                                                                                                                                                                                                                                                                                                                                   This sequence is a primer for DNA encoding the human haematopoietic stem cell growth factor (SCGF) of the invention. The polypeptide of the invention is of mammalian origin and has haematopoietic stem cell growth factor SCGF activity, including burst-promoting activity (BPA) and granulocyte macrophage colony stimulating activity (GPA). The products can be used for treatment, diagnosis and analysis of haematopoietic cell disorders and bone marrow inhibition, e.g. by cytotoxic anticancer agents such as 5-fluorouracil. The products can also be used for amplification of haematopoietic cells in vitro, e.g. for use in marrow grafting and gene therapy by insertion of SCGF gene using a suitable therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Haematopoietic stem cell growth diagnosis of haematopoietic cell inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haematopoietic stem cell growth factor; SCGF; b BPA; granulocyte macrophage colony stimulating GPA; haematopoietic cell disorder; bone marrow

Housman D, Ledley FD, Stanton ď,

Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

Disclosure; Fig 7; 605pp; English.

This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient a first allele Specific inhibitor (ASI) targeted to an allele of a first essential gene CC specific inhibitor (ASI) targeted to an allele of a first essential gene CC calls of the patient are heterozygous for the first gene, the inhibitor CC calls of the patient are heterozygous for the first gene, the inhibitor CC calls of the patient are heterozygous for the first gene, the inhibitor CC calls of the galation and targets only one allelic forms of the gene CC used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease the mathod can also be used to remove CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent CC human polymorphic sites described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC used for preventing the development of cancer in a patient having a CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administraing to the patient a first allele CC specific lihibitor (ASI) targeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal somatic CC cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be CC used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic CC concers, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove considered the product of the product of the product of the premove transplants. AAZ25812-Z26825 represent

The recombinant protein is used as a modulator of heparin-
binding growth factors, cellular responses to heparin-binding growth
factors and cytokines, cell interaction with plasma lipoproteins,
cellular susceptibility to viral, protozoal and bacterial infections or
disintegration of neurodegenerative plaques. Heparanase may be useful fo
conditions such as wound healing, angiogenesis, restenosis, and viral
infections. Mammalian heparanase can be used to neutralize plasma
heparin, and anti-heparanase antibodies may be applied for
immunodetection and diagnosis of micrometastases, and body fluids. The
present PCR primer was used to amplify hpa cDNA, in the course of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is a PCR primer for DNA encoding a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, leukaemias, lymphomas, osteosarcomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated vertebrate telomerase genes - used to develop treating cancers or for organ regeneration, nerve cell or b growth following injury or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                         AAX79141 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

These genes are Muts homologues (MSH) from plants and are involved in DNA mismatch repair. The DNA sequence can be used in processes for at least partially inactivating a DNA mismatch repair system of a plant, for increasing genetic variation in a plant, and for obtaining a plant with a desired characteristic primers AAX79105-X79160 represent 28 primer pairs used to amplify short allelic repeat fragments designated Simple Sequence Length Polymorphisms (SSLP). These fragments can be used as markers in the analysis of

```

The present sequence is a reverse primer cmar8 used for amplification (detection of mutations in paraplegin gene exon from hereditary spastic paraplegia (HSP) patients. Detection of mutations in paraplegin gene helps in the diagnosis and treatment of various forms of HSP or other neurodegenerative conditions, such as Amyotrophic Lateral Sclerosis

                                                                                                                                            The present PCR primer was used to amplify a human cDNA sequence, which encoded a protein with heparanase catalytic activity. The heparanase (hpa) polynucleotide is useful in gene therapy, particularly in treating tumour, inflammation or autoimmunity. Particularly, the polynucleotide is useful in modulating the bioavailability of heparin-binding growth factors, cellular responses to heparin-binding growth factors (e.g. bFGF) and cytokines (e.g. interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular susceptibility to certain viral and some bacterial and protozoa infections, or disintegration of neurodegenerative plaques. The polynucleotide is also useful in wound healing (e.g. thermal, chemical or radiation burns), and in the treatment of angiogenesis, restenosis, atherosclerosis, inflammation, neurodegenerative diseases (Gerstmann-Straussler Syndrome or Creutzfeldt-Jakob disease), and some
                                                                                                                                                                                                                                                                                                                                                                 New polynucleotides encoding a polypeptide having heparanase activity, useful in wound healing and in gene therapy, particularly in treating tumor, inflammation, autoimmunity, neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                           Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (HADA-)

                                                                                                                                               AAZ65654 to AAZ69578 represent human biallelic markers from the present clinvention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

DAGK converts diacy_lglycerol (DAG) to phosphatidic acid and attenuates DAG-dependent protein kinase C activation. Compounds that modulate the activity of DAGKbeta may be administered to a human patient for the treatment or prophylaxis of a disorder that is responsive to modulation of DAGK activity. The disorder may be a mood disorder, epilepsy, a neurodegenerative disorder, anxiety, achizophrenia, migraine, drug dependence, stroke, Alzheimer's dementia or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myccardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembol pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids comprising single nucleotide polymorphisms, us applications such as forensics, paternity testing, medicine, analysis and phenotype correlations to diseases such as diab atherosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The present invention provides a method of diagnosing a vascular diseas in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin genes. The sequences at a number of polymorphic sites are also provided

disease

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thrombosmbolism an pulmonary embolism. Single nucleotide polymorphisms (SNPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

PCR primers AAH28472-73 were used to amplify DNA encoding a human slit protein polypeptide, designated Zslit. Zslit is a neurite growth and development modulator, and an cellular proliferation and differentiation and immune response modulator. Zslit polypeptides and polynucleotides are useful for regenerating and directing neurite outgrowths following strokes, brain damage caused by head injuries, paralysis caused by spinal injuries, and for treating neurodegenerative diseases such as amyotrophic lateral sclerosis, Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases e.g. multiple sclerosis. They are useful for lung organogenesis and repair, and thus useful for diagnosing and treating pulmonary diseases such as respiration and circulation, cystic fibrosis and asthma. They also act as a mediator of immunosuppression, and thus are useful for diagnosing and treating autoimmune diseases such as insulin dependent diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Slit protein; Zslit3; neurite growth; cellular proliferation; immune response; stroke; brain damage; paralysis; Huntington's diseas; neurodegenerative disease; amyotrophic lateral sclerosis; Alzheimer's disease; Parkinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis; lung organogenesis; pulmonary disease; respiration; circulation; cystic fibrosis; asthma; immunosuppression; autoimmune disease; insulin dependent diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Holloway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pulmonary embolism. Single nucleotide polymorphisms (SNPs) are useful in forensics, paternity testing, genetic analysis and correlations to diseases. The present sequence is an example the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-DEC-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-JUN-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                              PCR primers AAH78642-43 were used to amplify a gene fragment of the human mechanically sensitive potassium channel gene. The channel is activated by polyunsaturated fatty acids (particularly arachidonic acid (AA)) and by riluzole. The polypeptide is designated human TWICK-related AA-activated potassium channel (hTRAAK). The hTRAAK gene is located on chromosome 11q13. hTRAAK is involved in regulation of neuronal and muscle excitation, cardiac rhythm and secretion of hormones. Cells that express hTRAAK, designated to screen for modulators of hTRAAK activity. Such modulators are potentially useful for prevention or treatment, in humans and animals, of: cardiac and/or vascular disease; nervous system disorders associated with ischemia and anoxia; endocrinal diseases associated with anomalous hormone secretion or muscle diseases.
                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; mechanically sensitive potassium channel; riluzole; TWICK, polyunsaturated fatty acid; arachidonic acid; hTRAAK; chromosome neuronal excitation; muscle excitation; cardiac rhythm; anoxia;
                                      associated with anomalous retinal diseases. Typical

The channel is activated by polyunsaturated fatty acids (particularly arachidonic acid (AA)) and by riluzole. The polypeptide is designated human TWICK-related AA-activated potassium channel (hTRAAK). The hTRAAK gene is located on chromosome 11g13. hTRAAK is involved in regulation of neuronal and muscle excitation, cardiac rhythm and secretion of hormones. Cells that express hTRAAK, designated to screen for modulators of hTRAAK activity. Such modulators are potentially useful for prevention or treatment, in humans and animals, of: cardiac and only vascular disease, nervous system
                                                                                                                                                                                                                                                                                                      disorders associated with ischemia and anoxia; endocrinal diseases associated with anomalous hormone secretion or muscle diseases; and retinal diseases. Typical examples are epilepsy, cardiac arrhythmis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polyunsaturated fatty acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New mechanically sensitive potassium channel, useful for treating cardiovascular diseases and in drug screening, is activated by

                                                                                                                                                                                                                                                                               DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single nucleotide polymorphism; SNP; human; heart disease; paternity testing; forensic (

A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to detecting a genetic predisposition in a human subject for non-responsiveness to statin drug treatment, involving amplifying nucleic acids including a non-coding or untranslated region within the 3' end of the human lipoprotein lipase (LPL) gene from a tissue sample. The method is useful for determining which partients suffering from coronary artery dypass graft (CABG) patients, will likely not respond positively to statin drug treatment with respect to stenosis of a coronary artery or bypass graft
                                                                                                                                                                                                                                                                                         Breast amplified G protein coupled receptor; BCA-GPCR; chromosome 1q44; BCA-GPCR-1; BCA-GPCR-2; BCA-GPCR-3; BC signal transduction; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genetic testing for determining non-responsiveness to statin drug in patients of a coronary artery disease, involves analyzing amplification products for homozygosity for a variant allele in the human lipoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ,02-JUL-1999;

BCA-GPCRs are amplified and/or overexpressed in breast cancer cells. The BCA-GPCRs are located at chromosome 1q44, in the following orientation (starting from the centromere end): BCA-GPCR-1 (3'-5' orientation), BCA-GPCR-2 (5'-3' orientation), BCA-GPCR-3 (3'-5' orientation), BCA-GPCR-3 (3'-5' orientation), and BCA-GPCR-4 (5'-3' orientation), BCA-GPCR-3 (3'-5' orientation), and BCA-GPCR-4 (5'-3' orientatifying modulators of G-protein coupled receptor signal transduction. The modulators and antibodies against the G protein coupled receptors are useful for pharmacological modulation of signalling pathways, e.g. in cancer cells such as breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             such as breast cancer
The present invention relates to human oligonucleotides comprising single nucleotide polymorphic site (SN: AAH88797-AAH89219). The presented is one such oligonucleotide. The oligonucleotides can be usequence is one such oligonucleotide. The oligonucleotide with be used to the companion of polymorphisms with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                          The present invention describes a method of inentifying the presence of a cc plurality of genetic markers in a subject, involving generating extension cc products using PCR primers flanking the plurality of markers, separating ct the extension products depending on their melting temperatures, and can lysing them to determine the presence or absence of each genetic marker. This can be used in the diagnosis of genetic diseases, including cmarker. This can be used in the diagnosis of genetic diseases, including csickle cell disease, phenylketonuria, galactosaemia, fragile X syndrome, csickle cell disease, phenylketonuria, galactosaemia, fragile X syndrome, csickle cell disease, cystinuria, methylmolonic acidaemia, urea cycle maturity onset diabetes, cystinuria, methylmolonic acidaemia, urea cycle disorders, hereditary fructose intolerance, hereditary haemochromatosis, coliperase, acaptonuria, hypolactasia, Baker's disease, tyrosinaemia, Wilson's cdisease, acaptonuria, hypolactasia, Baker's disease, argininaemia, cc ancitryppsin deficiency, Duchenne muscular dystrophy, Marfan's syndrome, neurofibromatosis, osteogenesis imperfecta, retinoblastoma, Freidrich's cataxia, haemoglobinopathies, Leber's hereditary optic neuropathy, MCAD, canxiaria, haemoglobinopathies, Leber's hereditary optic neuropathy, MCAD, canxiaria, cantitrypsin deficiency cetinitis pigmentosa, Bloom syndrome, Franconi anaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                      The invention relates to nucleic acid molecules with endonuclease activity, which are particularly useful for cleavage of RNA or DNA. The nucleic acids are used in a pharmaceutical composition and are used to modulate expression of a gene in a plant, mammalian, bacterial or fungal cell. They are used to cleave a separate nucleic acid, preferably RNA. The nucleic acids are used to inhibit gene expression and/or cell proliferation, and can be used to treat a disease or condition. More than one nucleic acid can be independently targeted to the same or different sites in a cell. The nucleic acids may be used to study DNA. The modifications to the nucleic acids optimises their catalytic activity and can maintain or enhance their activity. They exhibit a high degree of specificity for RNA. The present sequence represents the Class VII ribozyme, substrate domain, used in an example which demonstrates the method of the invention
                                                                                                                                                                                                                                                                                                                                                          New nucleic acids with endonuclease activity, such as ribozymes and nucleozymes, for modulating gene expression in a plant, mammalian, bacterial or fungal cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                (RIBO-)

                                                                                 The invention relates to nucleic acid molecules with endonuclease activity, which are particularly useful for cleavage of RNA or DNA. The nucleic acids are used in a pharmaceutical composition and are used to modulate expression of a gene in a plant, mammalian, bacterial or fungal cell. They are used to cleave a separate nucleic acid, preferably RNA. The nucleic acids are used to inhibit gene expression and/or cell proliferation, and can be used to treat a disease or condition. More than one nucleic acid can be independently targeted to the same or different sites in a cell. The nucleic acids may be used to study DNA. The modifications to the nucleic acids optimises their catalytic activity and can maintain or enhance their activity. They exhibit a high degree of specificity for RNA. The present sequence represents the Class I-XII ribozyme substrate, used in an example which demonstrates the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 misc_binding

                                                                                                                                                              The present invention relates to a method for sorting genes. The method comprises producing first double stranded (ds) cDNA from mRNA by reverse cranscription using a poly-T primer. The ds cDNA is then digested with a creativation enzyme that generates cohesive ends with overhanging single creativation enzyme that generates cohesive ends with overhanging single creativation products are ligated to a set of ds DNA oligonucleotide, and the city of the daptor has at one end, a sequence complementary to a gossible overhang and the other end a primer-template sequence specific creative for the adaptor complementary sequence, and between these two ends the creative for the adaptor complementary sequence. An eligated cDNA moleculas are amplified in separate PCR assays, using for each a primer that anneals to comply and a second primer, from a set that anneals to the CDNA specific primer-template sequences. Amplicons are finally sorted into non-credundant groups defined by the specific primer that annealed to the primer-template sequences and thus primed PCR. The method is useful for primer-template sequences and thus primed PCR. The method is useful for compressed-gene transcript in the original sample is represented by the swn subgroup. The method is also useful for isolation, identification or analysis of genes, analysis and diagnosis of diseases, for studying cell differentiation and in gene therapy. The present sequence was used to illustrate the method of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a transgenic plant comprising heterologous DNA coding for eukaryotic thioredoxin reductase integrated into its nuclear or plastid genome and use of thioredoxin reductase for separating the starch and protein components of grain in a milling process. Transgenic plant is used for separating the starch and protein components of grain in a milling process. Transgenic plant may be used to produce thioredoxin reductase at elevated levels. Delivery of thioredoxin reductase eliminates the need to develop exogenous sources for addition during processing. Secondly, physical disruption of seed integrity is not necessary to bring the enzyme in contact with the storage or matrix proteins of the seed prior to processing or as an extra processing step.

The present sequence is Arabidopsis NADPH dependent trx reductase gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a true grass plant in which a base sequence encoding a human interferon protein, with a base sequence encoding a signal amino acid sequence causing accumulation of the stored protein of albumen to the protein body connected upstream, is recombined expressably to a genomic DNA. The grass plant can be used for the creation of a useful application of tea. The present sequence represents a PCR primer which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a new composition for treating hormone regulated cancer. The composition comprises an antisense oligonucleotide that inhibits expression of IGFBP-2 (insulin-like growth factor binding protein-2). The molecules of the invention are used to delay progression of hormone-regulated tumours, particularly of breast or prostate, to the hormone independent state, to delay metastatic progression to the bone of IGF-1-sensitive cancers and to treat hormone-responsive cancers by inducing apoptosis, after hormonal withdrawal. The present nucleic acid sequence represents one of a collection (ABK70313-ABK70375) of antisense IGFBP-2-oligodeoxynucleotides (ODN) that were used in the invention for
                                           The invention relates to producing multicellular plants, organs or tissues transformed on their plastome, comprising altering/disrupting the function of a gene in a plastid genome for producing a selectable phenotype and selecting plants with plastids expressing the phenotype, transforming the plastid genomes of selected plants with a transformation vector with a restoring sequence for restoring function and separating transformed plants. This method is useful for producing multicellular plants, organs or tissues transformed on their plastome and for selection of antibiotics and herbicide resistance genes. Sequences ABS52237-ABS52269 represent PCR primers used to amplify plant vector genes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plant; PCR;
